

**ABSTRACT OF THE DISCLOSURE**

This invention (method/process) is unique in the fact that there is nothing like it on the market today. This method or process allows a skateboard to be attached to the bottom of a backpack. This provides the carrier of the backpack to either carry the backpack and skateboard together as one unit, or will also allow the carrier to remove the skateboard and ride it, while carrying the backpack on their back. Additionally, for smaller children with their backpacks heavy with school books, while the skateboard is attached, the child can pull their backpack alongside them as they walk. This process relieves their backs from the weight of the heavy backpack and allows them to still move the backpack along side them as they walk.
